                      canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine it-4, canine or feline FIL-3 ligand, canine or feline CD40, canine or feline CD40, interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as
                                                                                                         vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

Sequences Y58221-Y58222 and Y58223-Y58224 represent encoded and mature canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine IL-4, canine or feline CD154 (CD40 ligand), canine or feline CD40, canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated immunoregulatory proteins. The proteins, their associated concleic acids, specific antibodies and inhibitors may be used as vaccines for therapeutic or prophylactic regulation of an immunor response in animals (particularly cats, dogs, horses and humans). They may be used to treat autoimmune or infectious diseases including the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 MYCAALESLINVSDCSAIQRTQRMLKALCSQKPAAG-ISSERSRDTKIEVIQLVKNLLTY 119

The invention relates to canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine or feline CD154 (CD40 ligand, canine or feline CD40, canine in the companie CD40 canine or feline CD40, canine IL-13, feline interferon-alpha (IRN-alpha) and feline granulocyte macrophage colony-stimulating factor (GMCSF), and nuclectides warched these immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as nucleic acids, specific antibodies and inhibitors may be used as companies for therapeutic or prophylactic regulation of an immune consider, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for and antipodies and to screen for and antipodies and be used in detection, and also activity, while the antibodies may be used in detection,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

Sequences Y58221-Y58222 and Y58224 represent encoded and mature canine interleukin-13 (IL-13) clones 80 and 78. The invention relates to canine IL-4, canine or feline CD40.

Canine or feline CD154 (CD40 ligand, canine or feline CD40, canine or feline CD40.

Canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline interferon-alpha (IFN-alpha) and feline granulocyte macrophage

CC colony-stimulating factor (GMCSF), and nucleotides which encode these immunoregulatory proteins. The proteins, their associated

CC vaccines for therapeutic or prophylactic regulation of an immune response in animals (particularly cats, dogs, horses and humans).

They may be used to treat autoimmune or infectious diseases including allergies, tumours, inflammation and graft rejection, and to increase the response from a co-administered antigen. The nucleotide sequences can also be used for the recombinant production of a protein, while nucleotide fragments are useful as probes, as amplification primers and as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for modulators of activity, while the antibodies may be used in detection,

                                                                                                                                                                                                                                                                                                                                                                                                                          A novel cytokine produced by T lymphocytes induced by phorbol-2-mayistate-3-acetate and phytohaemaglutinin was coded for by the sequence in clone pSE1-NC30. A second clone was also identified (pSE1-NC30bis) which differed only in the identity of coden 41. The corresponding proteins differ in the amino acid at position 41 which is ather Asp (in NC30) or Gly (in NC30bis). The cytokine acts on monocytes and B lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Interleukin-13; lymphokine; P600; immunological disorder; therapy;

                                                                                  An approx. 400 bp DNA fragment derived from a Pst/PvuII restriction digest of the mouse P600 cDNA clone was isolated. This fragment, which encompasses most of the coding region of the mouse P600 cDNA, was radioactively labelled and hybridised with filter lifts prepditor a cDNA library made from a clone of an AlO T cell line. One clone, designated PA 10.66, was subcloned into M13 and sequenced. This sequence encodes human IL-13.

Muteins .1 and 2 (R92793-94) of human interleukin-13 (IL-13) contain amino acid substitutions at amino acid position 11 in helix A and/or at position 64 in helix C. They are obtd. by site-directed mutagenesis of natural IL-13 sequences. The muteins antagonise the activity of IL-13 or IL-4. They have partial cytokine agonist activity of IL-13 or IL-4. They have partial cytokine agonist crivity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine muteins (see also R92790-92, R92795-802) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.
                                                                                                                                                                                                                                                                                                                                 22 PVTPSPTLKELIEELVNITQNQ-ASLCNGSMVWSVNLTAGMYCAALESLINVSDCSAIQR 80
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This protein is one of two possible forms of a new cytokine produced by T lymphocytes induced by phorbol-2-mysistate-3-acctate and phytchaemaglutinin. The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts on monocoytes and B lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                  2 pyppstalrelieelvnitqnqkaplcngsmvwsinltagmycaaleslinvsgcsaiek

                                                                                                                                                                                                                                                                                                                 An approx. 400 bp DNA fragment derived from a Pst/PvuII restriction digest of the mouse P600 cDNA clone was isolated. This fragment, which encompasses most of the coding region of the mouse P600 cDNA, was radioactively labelled and hybridised with filter lifts prepd from a cDNA library made from a clone of an A10 T cell line. One clone, designated PA 10.66, was subcloned into M13 and sequenced. This sequence encodes human IL-13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Mutein(s) of human and murine cytokine(s), esp. interleukin(s) and murine P600 contg. amino acid substitutions. - useful for the diagnosis and treatment of cancer, inflammation, etc.

They are obtd. by site-directed mutagenesis of natural IL-13 sequences. The muteins antagonise the activity of IL-13 or IL-4. They have partial cytckine agonist activity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytckine activity by least about 50% when present at a 100-fold excess. They and other cytckine muteins (see also R92790-92, R92795-802) are useful in the screening of cytckine and cytckine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This protein is one of two possible forms of a new cytokine produced by T lymphocytes induced by phorbol-2-myristate-3-acetate and phytohaemaglutinin. The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts on monocytes and B Lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2 pvppstalrelieelvnitqnqkaplcngsmvwsinltadmycaaleslinvsgcsaiek

The b4 peptide is a preferred signal peptide to be fused to the N-terminus of the new cytckine. The last two amino acids (Ser-Pro) are opt. absent; when absent the signal peptide is designated b3. See Q28942-Q28947.
                                                                                                                                                                                                                             Caput D, Ferrara P, Guillemot J, Kaghad M, Labit-le Bouteiller C;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Muteins of mouse, P600 (R92795) contain amino acid substitutions at amino acid position 67 in helix C. They are obtd. by site-directed mutagenesis of natural P600 sequences. The muteins antagonise the activity of IL-13 or IL-4. They have partial cytokine agonist activity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine muteins (see also R92796-94), R9796-803) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.

The polynucleotide sequences given in C69455 to C69502 encode the human secreted proteins given in B38203 to B38250. B38251 to B38320 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in. Example of activities include: immunosuppressive; antiatrhritic; antirheumatic; antiproliferative; cytostatic; cardiant; virucide; fungicide; and ophthalmological. The polymolective; antibacterial; virucide; fungicide; and ophthalmological. The polymolectides and polymolective in menson and polymolective in the polymolectides and confolicient of prevent, treat or amelicate a medical confolicient or sheep. They are also used in diagnosing a pathological

"A family of small inducible proteins secreted by leukocytes are members of a new superfamily that includes leukocyte and indicators of various activation processes.";
J. Immunol. 142:679-687(1989).
-!- FUNCTION: CYTOKINE. INHIBITS INFLAMMATORY CYTOKINE PRODUCTION. SYNERGIZES WITH ILZ IN REGULATING INTERPERON GAMMA SYNTHESIS.
MAY BE CRITICAL IN REGULATING INFLAMMATORY AND IMMUNE RESPONSES
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       01-NOV-1995 (Rel. 32, Created)

                  PATHWAY: NUCLECTIDE AND DEOXYRIBONUCLECTIDE CATABOLISM.
SUBUNIT: HOMODIMER.
DISEASE: DEFECTS IN ECGF1 ARE THE CAUSE OF MITOCHONDRIAL
NEUROGASTROINTESTINAL ENCEPHALOMYOPATHY (MNGIE) (ALSO KNOWN AS
MYONEUROGASTROINTESTINAL ENCEPHALOMYOPATHY); AN AUTOSOMAL
RECESSIVE HUMAN DISEASE ASSOCIATED WITH MULTIPLE DELETIONS OF
SKELETAL MUSCLE MITOCHONDRIAL DNA (MTDNA). IT IS CLINICALLY
CHARACTERIZED BY ONSET BETWEEN THE SECOND AND FIFTH DECADES OF
LIFE, PTOSIS, PROGRESSIVE EXTERNAL OPHTHALMOPLEGIA,
                                                                                                                                                                                                                                                               CATALYTIC ACTIVITY: THYMIDINE + PHOSPHATE = THYMINE + 2-DEOXY-D-RIBOSE 1-PHOSPHATE.
                                                                                                                                                                                                                                                                                                                                  ENDOTHELIAL CELLS IN VITRO.

FUNCTION: CATALYSES THE REVERSIBLE PHOSPHOROLYSIS OF THYMIDINE.

THE PRODUCED MOLECULES ARE THEN UTILIZED AS CARBON AND ENERGY
SOURCES OR IN THE RESCUE OF PYRIMIDINE BASES FOR NUCLEOTIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: MAY HAVE A ROLE IN MAINTAINING THE INTEGRITY OF THE BLOOD VESSELS. HAS GROWTH PROMOTING ACTIVITY ON ENDOTHELIAL CELLS, ANGIGGENIC ACTIVITY IN VIVO AND CHEMOTACTIC ACTIVITY ON
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ب

   CC Sequences Y58221-Y58222 and Y58223-Y58224 represent encoded and mature CC canine interlewkin-13 (IL-13) clones 80 and 78. The invention relates to CC canine IL-4, canine or feline Ftt-3 ligand, canine or feline CD40, CC canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline CC canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline CC canine or feline CD154 (CD40 ligand), canine IL-5, canine IL-13, feline CC colony-stimulating factor (GMCSF), and nucleotides which encode these CC immunoregulatory proteins. The proteins, their associated nucleic acids, specific antibodies and inhibitors may be used as CC vaccines for therapeutic or prophylactic regulation of an immune CC response in animals (particularly cats, dogs, horses and humans).

CC They may be used to treat autoimmune or infectious diseases including CC alletgles, tumours, inflammation and graft rejection, and to increase CC the response from a co-administered antigen. The nucleotide sequences CC can also be used for the recombinant production of a protein, while CC nucleotide fragments are useful as probes, as amplification primers and CC as sources of inhibitory therapeutics (e.g., antisense oligonucleotides). The proteins may be used to raise antibodies and to screen for CC modulators of activity, while the antibodies may be used in detection,

  This protein is one of two possible forms of a new cytokine produced by T lymphocytes induced by phorbol-2-myristate-3-acetate and phytohaemaglutinin. The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts on
Sequence
   amino acid substitutions at amino acid position 11 in helix A and/on at position 64 in helix C. They are obtd. by site-directed mutagenesis of natural II-13 sequences. The muteins antagonise the activity of II-13 or II-4. They have partial cytokine agonist activity, exhibit less than 80% maximal agonist activity of natural II-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine muteins (see also R92790-92, R92795-802) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.

  An approx. 400 bp DNA fragment derived from a Pst/PvuII restriction digest of the mouse P600 cDNA clone was isolated. This fragment, which encompasses most of the coding region of the mouse P600 cDNA, was radioactively labelled and hybridised with filter lifts prepd. from a cDNA library made from a clone of an AlO T cell line. One clone, designated PA 10.66, was subcloned into M13 and sequenced. This sequence encodes human II-13.

This protein is one of two possible forms of a new cytokine produced by T lymphocytes induced by phorbol-2-myristate-3-acetate and phytohaemaglutinin. The proteins differ only in the amino acid at position 41 which is either Asp or Gly. The cytokine acts, on monocytes and B lymphocytes and is useful in treatment of tumours and some infections and inflammatory conditions.

   A novel cytokine produced by T lymphocytes induced by phorbol-2-mylistate-3-acetate and phytohaemagilutinin was coded for by the sequence in clone pSE1-NC30. A second clone was also identified (pSE1-NC30bis) which differed only in the identity of codon 41. The corresponding proteins differ in the amino acid at position which is either Asp (in NC30) or Gly (in NC30bis). The cytokine acts on monocytes and B lymphocytes and Is useful in treatment o tumours and some infections and inflammatory conditions.

The invention relates to a new method of modulating or decreasing apoptosis in mammalian beta cells of Islets of Langerhans, endothelial cells or nerve cells. The method comprises administering a mammalian heparin-binding protein (HBP) which in a glycosylated form has: (i) a molecular weight of 28 kDa; (ii) is a produced in the azurophil granules of polymorphonuclear leukocytes: and (iii) is a chemoattractant for monocytes. The new protein is useful for preventing or treating a disorder (preferably in human patients) resulting from apoptosis of mammalian cells, including insufficient functioning of insulin production or insulin action, a neurodegenerative disorder, a neuromuscular disorder, human immunodeficiency virus and ischemic stroke. Compositions (a) comprising HBP and a proteogy of and ischemic stroke. Compositions (a) comprising the HBP and a proteogy of a mammalian mitochondrial matrix targeting protein and which binds to the HBP are useful for modulating or decreasing apoptosis in mammalian beta cells of islets of Langerhans, endothelial cells or nerve cells. Unlike prior inhibitors, the new apoptosis inhibitor of apoptosis inhibitor of apoptosis such as cancer, autoimmune disorders such as systemic lupus erythematosus, immune-mediated glomerulonephritis, and viral infections. The present sequence represents a mature human HBP.

  mino acid most to the factor of the factor of the factor of mutagenesis of natural P600 sequences. The mutains antagonise the activity of IL-13 or IL-4. They have partial cytokine agonist activity, exhibit less than 80% maximal agonist activity of natural IL-2, and/or antagonize cytokine activity by least about 50% when present at a 100-fold excess. They and other cytokine mutains (see also R92790-94, R92796-802) are useful in the screening of cytokine and cytokine receptor levels, and in the diagnosis or treatment of e.g. inflammation, cancer, and degenerative disorders.

   The sequence was obtd. from several overlapping clones isolated from a human skeletal muscle cDNA library in lambda gt10. The protein encodes the human ryanodine receptor (HRR), a calcium release channel which spans the gap between the transverse tubule and the sarcoplasmic reticulum (SR) in muscle. The sustained muscle contraction in malignant hyperthermia (MH) may be caused by the release of calcium into the muscle cell cytoplasm from the SR. This is due to a defect in the gene encoding HRR. Sequences from the gene can be used for diagnosis of MH using FRPL analysis. The protein sequence would give rise to several transmembrane passages in the C-terminal fifth of the molecule; the bulk would be hydrophilic. This matches well with the structure of known ryanodine receptors. The peptides in the feature table were determined from

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

SUBUNIT: HOMOTETRAMER (POTENTIAL).

DISEASE: A DEFICIENCY IN THE RYANODINE RECEPTOR MAY BE THE CAUSE OF MALICHANT HYPERTHERMIA (MH) AND OF CENTRAL CORE DISEASE OF MUSCLE (CCD). MH IS AN AUTOSOMAL DOMINANT DISORDER OF SKELETAL MUSCLE AND IS ONE OF THE MAIN CAUSES OF DEATH DUE TO ANESTHESIA. IN SUSCEPTIBLE PEOPLE, AN MH EPISODE CAN BE TRIGGERED BY ALL COMMONLY USED INHALATIONAL ANESTHETICS SUCH AS HALOTHANE AND BY
   MULTAL 15:122-122(2000).

FUNCTION: COMMUNICATION BETWEEN TRANSVERSE-TUBULES AND SARCOPLASMIC RETICULUM. CONTRACTION OF SKELETAL MUSCLE TRIGGERED BY RELEASE OF CA++ FROM SR FOLLOWING DEPOLARI
   T-TUBULES.

  -i-TISSUE SPECIFICITY: FAST- OR SLOW-TWITCH SKELETAL MUSCLE.
-i-MISCELLANBOUS: THE CALCIUM RELEASE CHANNEL IS MODULATED BY CA++,
MG++, APP, AND CALMODULIN.
-i-MISCELLANBOUS: THE CALCIUM RELEASE CHANNEL ACTIVITY RESIDES IN THE
C-TERMINAL REGION WHILE THE REMAINING PART OF THE PROTEIN
CONSTITUTES THE FOOT' STRUCTURE SPANNING THE UNCTIONAL GAP
BETWEEN THE SR AND THE T-TUBULE. IT IS POSSIBLE THAT THE FOOT
STRUCTURE INTERACTS WITH THE CYTOPLASMIC REGION OF THE
DIHYDROPYRIDINE RECEPPOR.
  MISCELLANEOUS: RYANODINE IS AN ALKALOID THAT BINDS TO THE CA-RELEASE CHANNEL IN JUNCTIONAL SR AND MODILATES ITS ACTIVITY. SIMILARITY: LOCAL & LOW WITH THE NICOTINIC ACETYLCHOLINE RECEPTOR (N-ACHR) SUBUNITS.
   Hohenegger M., Helimann G.; "Phosphorylation of serine 2843 in ryanodine receptor-calcium release channel of skeletal muscle by cAMP-, cGMP- and CaM-dependent protein
  Biochim. Biophys. Acta 1175:193-206(1993).
